Suggested Activity: Part 5

Reading Nguyen BH, Stewart SL, Nguyen TT, Bui-Tong N, McPhee SJ. Effectiveness of Lay Health Worker Outreach in Reducing Disparities in Colorectal Cancer Screening in Vietnamese Americans. <u>American Journal of Public Health</u>. 2015;105(10):2083-9.

Questions

- 1. What was the primary research question of this trial?
- 2. What was the primary endpoint? How was it measured?
- 3. What were the units of assignment in this trial?
- 4. What were the units of observation in this trial?
- 5. What was the major design employed in this trial? Was it a single factor design? A cohort or cross-sectional design?
- 6. Was any effort made to ensure that the units of assignment would be balanced across study conditions with respect to potential confounding variables? Did the team employ a priori matching or stratification, or constrained randomization?.
- 7. How would you characterize their approach to the analysis of the primary outcome? Did they used a mixed model? A randomization test? GEE? Another approach?
- 8. Was the analysis approach was appropriate for the design and the data? What are the implications for the results?
